Screening for anti-viral agents - by detecting the ability of agent to disrupt the interaction of a Bak protein and a viral protein

an

Disclosure: Fig 1; 24pp; English.

The sequence encodes Bak protein, which is a bcl-1 homologue which interacts with Epstein-Barr virus (EBV) early lytic cycle BHRF1 protein, and is capable of modulating apoptosis. The Bak gene is located on human chromosome-6 at 6p21-23. The protein may be used in complete or partial form, or as an epitope tag fusion protein, in a new virucide drug screening method, which involves combination of Bak protein and a viral protein (e.g. EBV BHRF1), exposure to a test compound, and monitoring for disruption of the interaction, e.g. by co-precipitation, protein interactive trapping or ELISA. Interaction of Bak and viral proteins allows viral replication or

	latency in the absence of apoptosis. Compounds which inhibit the interaction may be used as virucide, antitumour or diagnostic agents. Sequence 2094 BP: 410 A; 608 C; 606 G; 470 T;	Qy

Claim 6; Fig.5A-H; 66pp; English.
Claim 6. Fig.5A-H; 66pp; English.
Cdn-2 cDNA was isolated from a human placental genomic library using a 950 bp fragment of Cdn-1 cDNA. Expression of Cdn-2 in mouse progenitor B-cell FL5.12 cells decreased IL-3-induced apoptosis. The Cdn-2 protein displayed 97% amino acid identity with Cdn-1 (R77876).

316 240 376 300 436 360 496 420 480 540 9/9 736 180 919 9 prods. for cell proliferation ρχ used Gaps a negative Claim 6; Fig 4; 100pp; English.

A full-length cDNA clone (T17375) codes for Bcl-Y (R81451), a profein that induces apoptosis in cells and functions as a negative regulator of Bcl-2 function. It was isolated from a Jurkat cell cDNA library using as probe a partial Bcl-Y cDNA clone obtd. by PCR of DNA derived from the Namalwa cell line. The cDNA can be use for prodn. of recombinant Bcl-Y, as a probe, to produce transgenic animal models, and in the gene therepy of disorders characterised b inappropriate cell proliferation or cell death.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           731
                                                                                      The sequence encodes Bax-2 protein, which is a bcl-1 homologue which interacts with Epstein-Barr virus (EBV) early lytic cycle BHRE1 protein, and is capable of modulating apoptosis. The Bax-2 gene is located on human chromosome-20. The protein may be used in complete or partial form, or as an epitope tag fusion protein, in a new virucide drug screening method, which involves combination of Bax-2 protein and a viral protein (e.g. EBV BHRE1), exposure to a test compound, and monitoring for disruption of the interaction of Bax-2 and viral protein interactive trapping or ELISA. Interaction of Bax-2 and viral proteins allows viral replication or latency in the absence of apoptosis. Compounds which inhibit the interaction may be used as virucide, antitumour or diagnostic agents. Sequence 1286 BP; 298 A; 341 C; 328 G; 319 T;

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having quanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prode. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having quanty cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol Wt. of 115 kD (calculated Mr—114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                              09-APR-1991 (first entry)
Human Natriuretic Peptide Receptor B.
NPRB; ANP; BNP; CNP; kidney failure; heart failure; protein kinase;
hyperaldosteronism; glaucoma; guanyl cyclase.

Introducing random point mutations into nucleic acods -
Introducing random point mutations into nucleic acods -
Introducing random point mutations into nucleic and screening.

This corporation, completion of molecules and screening.

Disclosure; p; English.

Random point mutations were introduced into the alpha fragment of consistences and solutained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all consistence included the possible nucleotide positions within a specified region. The reverse transcriptase and the molecules are misincorporated by the ranscriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which consists possible in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ĥ

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

                 (ampicillin resistant) Raitel-Not I Rsite2-Eco RI Female. Ist Strand obbt was primed with a Not I - oligo(df) primer [5' strand obbt was primed with a Not I and off primer 3', double-stranded cDNA was size selected, ligated to Eco RI adapters double-stranded cDNA was size selected, ligated to Eco RI adapters obbtamacia), dispessed with Not I and cloned into the Not I and Eco RI sites of a modified pi713 vector (Pharmacia). Library constructed by Bento Soares and M.Fatima Bonaldo.

CDNA was synthesized using a XhoI-Oligo, dT adaptor-primer. EcoRI adaptors were ligated, followed by digestion with XhoI, for directional cloning into predigested lambda ZAP Express.
                                                                                                                                                                                                                       N83998 232 bp mRNA EST 01-APR-1996

Tat primer=M13 - 21 library=Rat PC-12 cells, untreated vector=pBluescript SK- Rsitel=EcoRI Rsite2=XhoI poly(A)+ RNA was purified from untreated PC12 cells cultured for 9 days. cDNA was constructed using an oligo-dT primer and directionally cloned using the Lambda ZAP II Vector Kit by Stratagene.
                                                                                           Marra,M., Hillier,L., Allen,M., Bowles,M., Dietrich,N., Dubuque,T., Gelsel,S., Kucaba,T., Lacy,M., Le,M., Martin,J., Morris,M., Schellenberg,K., Steptoe,M., Tan,F., Underwood,K., Moore,B., Theising,B., Wylle,T., Lennon,G., Soares,B., Wilson,R. and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3/); double-stranded CDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified py 773 vector. RNA provided by Dr. Bertrand Jordan. Library went through three rounds of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo."

Tat primer-M13 Reverse library=Rat PC-12 cells, untreated vector=pBluescript SK- Rsitel=EcoRI Rsite2=XhoI poly(A)+ RNA was purified from untreated PC12 cells cultured for 9 days. cDNA was constructed using an oligo-dr primer and directionally cloned using the Lambda ZAP II Vector Kit by Stratagene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryotae; mitochondrial eukaryotes; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria; Rodentia; Sciurognathi; Myomorpha; Murinae; Rattus.
